A few notes

- Call will be recorded
- Keep it conversational
 - Raise hand
 - Use chat feature
 - Send additional thoughts/comments via email

Workshop Agenda

- Introductions
- Overview of Work Zone Performance Measurement
- Deep-Dive Sessions:
 - Safety
 - Mobility
 - Agency Efficiency
- Questions and Answers

23 CFR Part 630 Subpart J

- “Work Zone Safety and Mobility Rule”
 - Encourages States to develop and implement systematic procedures to assess work zone impacts and to manage safety and mobility during project implementation
 - Requires States to use field observations, crash data, and operational information to manage work zone impacts during implementation
- Agencies can improve these efforts through the use of work zone safety and mobility performance measures.

Work Zone Performance Measurement

What is it?

- Performance measurement is an outcome-based approach that uses objective and subjective evidence to quantify the degree to which an intended outcome is occurring over time.
- Work zone performance measurement quantifies how roadway construction impacts workers, travelers, residents, and businesses at the project and agency program levels.
- Successful performance monitoring is based on collecting, analyzing, and monitoring three types of data:
 - Performance data
 - Exposure data
 - Indicator data

Where is it used?

- Agencies conduct performance measurements in work zones where they would like to:
 - Compare the trends and patterns of safety, mobility, project quality, and customer satisfaction with agency goals
 - Evaluate the success of the intelligent transportation system deployments—specifically in the areas of safety and mobility

Why Measure and Manage Performance?

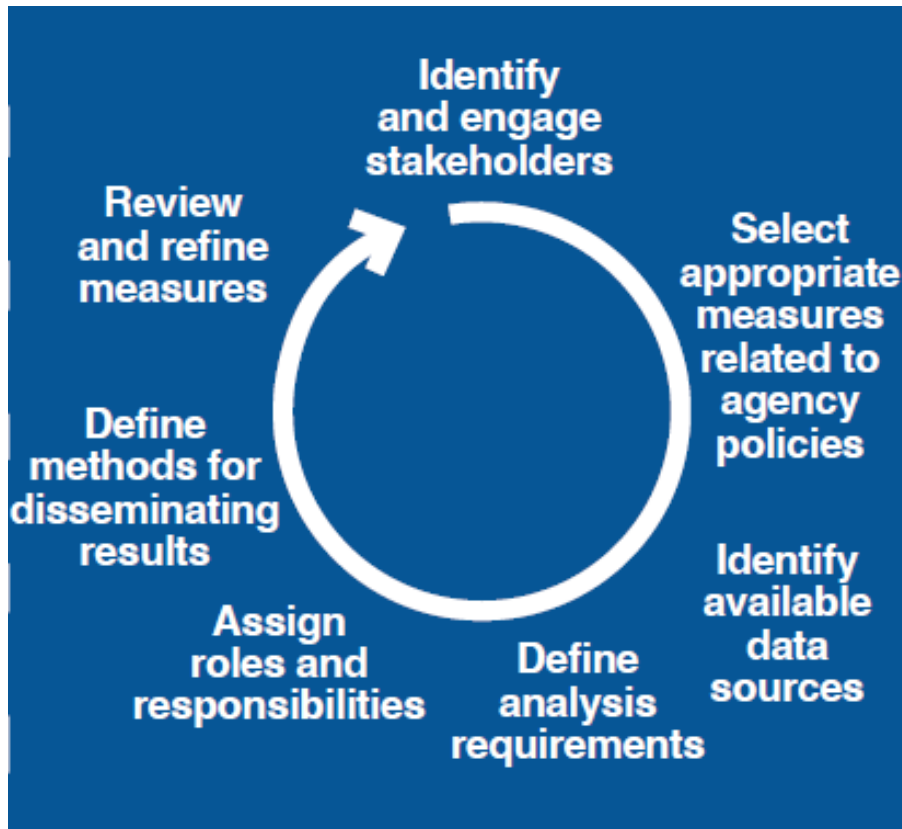

- “What gets measured gets managed.”
- Allows agencies to:
 - Understand how their work zone management decisions affect safety and mobility
 - Monitor and improve conditions at an existing work zone
 - Improve how they make future decisions regarding work zone management
 - Identify specific problems or issues that may be occurring
 - Review and improve work zone policies and procedures
 - “Tell the story” about work zone impacts and efforts to mitigate those impacts

Workshop Objectives

- Reemphasize work zone performance measurement (WZPM)
- Present examples of WZPM
 - Project-level and program-level WZPM
- Discuss the current state of practice
- Explore opportunities, methods, and resources for agencies to identify and implement WZPM at project and program levels.

Performance Measurement Areas and Process

Seven-step performance measurement process

Source: Webinar—“A Tutorial on Establishing Effective Work Zone Performance Measures” (www.workzonesafety.org)

Performance Areas:

- Safety, mobility, and agency efficiency

Selection and Evaluation of Performance Measures:

- Select performance measures matching agency goals
- Identify and determine data sources to use
- Decide work zone analysis scope and timeframe
- Compute specific measures of interest

Work Zone Performance Areas and Measures

Safety Performance

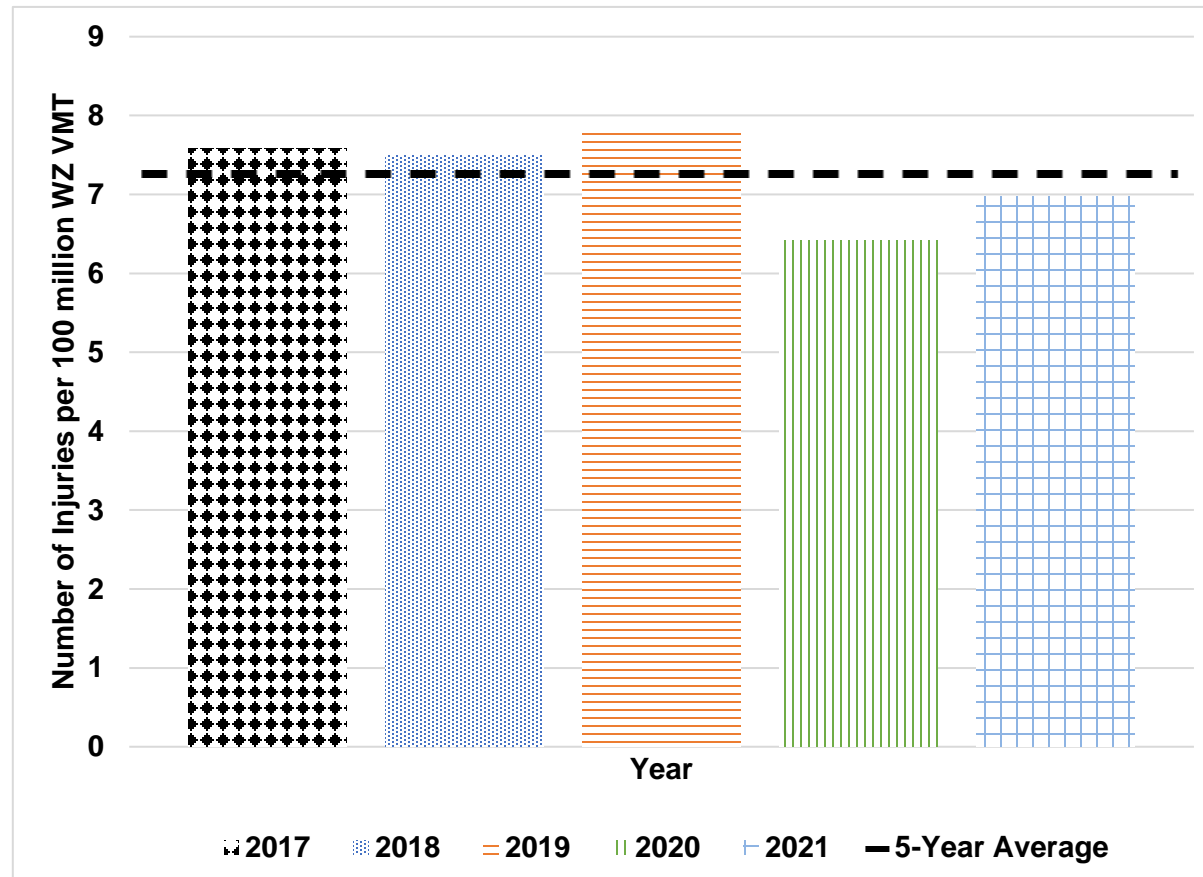

Why is it important to measure safety performance in work zones?

- Work zones present complex challenges (reduced lanes, diverging lanes, detours, reduced speeds) for motorists and traffic operators.
- Understanding, measuring, and quantifying the safety impacts of various aspects of work zones offer critical insights for proactive planning and management of work zones.

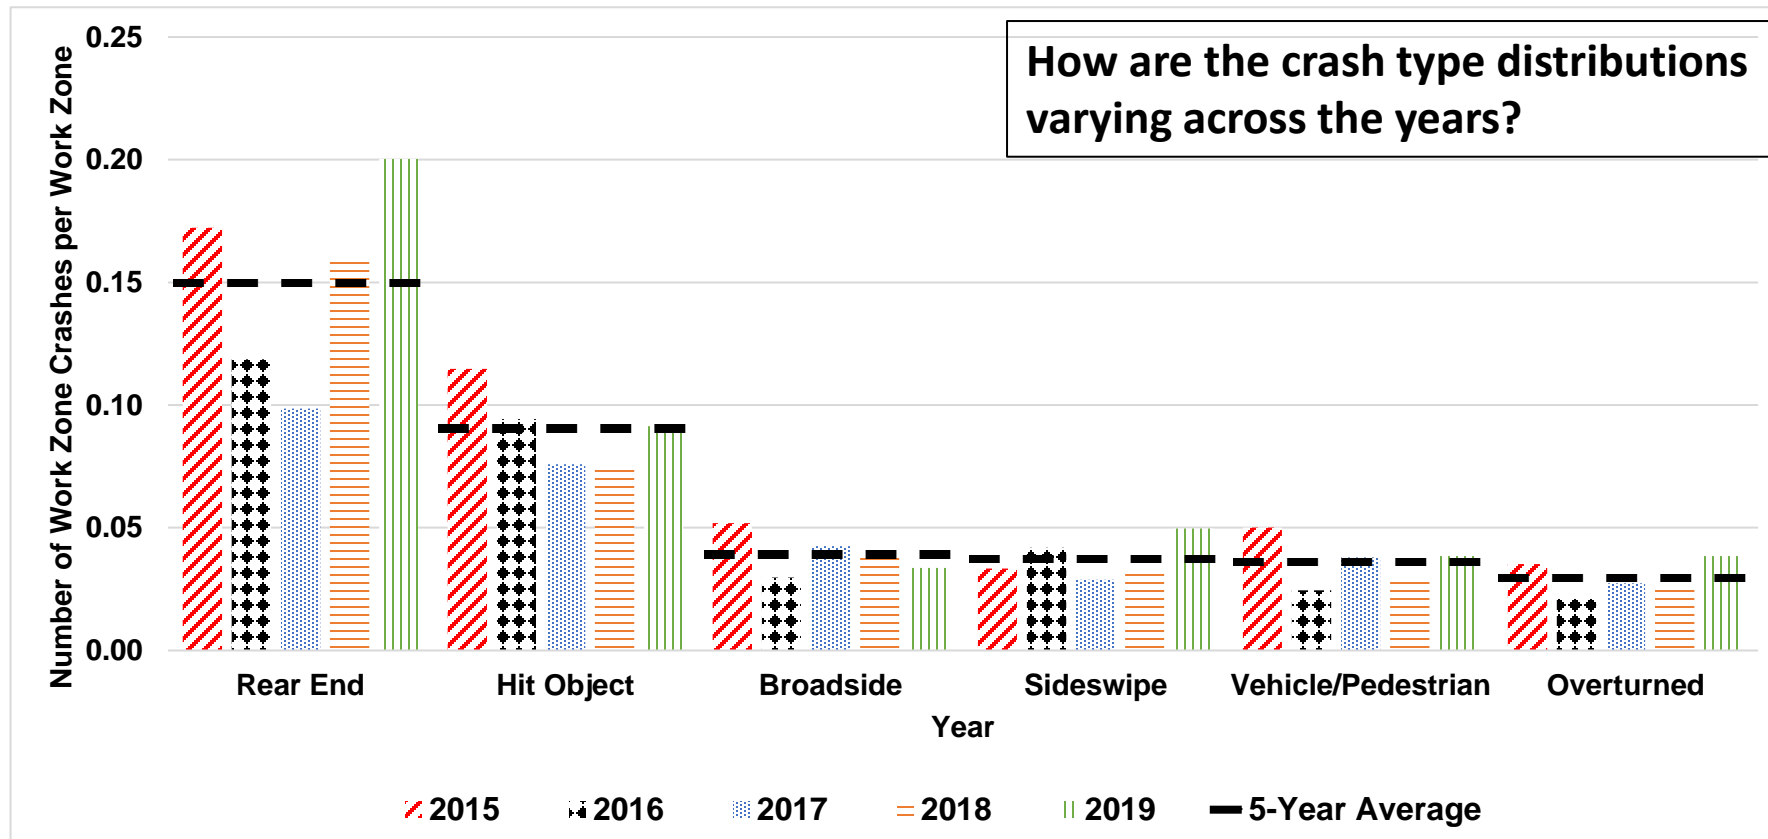

Safety Performance Measurement Examples (slide 1/4)

Safety Performance Measures

- Conventional Measures (Normalized)—Traditional Data:
 - Crashes per work zone vehicle mile traveled
 - Crash severity (fatality, injury, and property damage only) per work zone vehicle mile traveled
 - Worker incidents per work zone vehicle mile traveled
- Contextual Measures:
 - Crash contributing factors (distracted driving, speeding, driving under the influence, hitting work zone equipment)
 - Work zone crash location (termination area, activity area, transition area, advance warning area, and before the first work zone sign)
 - Crash types (e.g., sideswipe, head-on, rear-end, fixed object)
- Measures—Emerging Data:
 - Hard-braking events and locations

Survey Responses: Work Zone Exposure Data

Exposure data collected

Do you use your exposure data to normalize other performance measures?

7 out of 16 participants responded that they use exposure data to normalize performance measures. Most respondents mentioned that their agencies uses exposure data to normalize work zone crashes (crashes per VMT, crashes per 1,000 work zone miles, crashes per 1,000 work zone hours)

Survey Responses: Safety Performance Area (slide 1/2)

Does your work zone policy have a defined safety measure?

Safety Data Collected

12 out of 14 respondents mentioned that their work zone policy does not have a defined safety measure. States Collect and digitize detailed safety data. States also started exploring emerging data sources.

Survey Responses: Safety Performance Area (slide 2/2)

Do you filter your safety data to your work zones?

Do you use your safety data to quantitatively assess your work zones?

7 out of 14 respondents mentioned that their agencies filter data specific to work zone boundaries (spatial and temporal). 5 respondents mentioned that they use safety data to assess work zone performance. Most respondents indicated an annual cadence for performing program-level safety assessments.

Data Driven Work Zone Performance

Presentation by Chris Lambert

Online Peer Exchange | March 23, 2023

Vision

Striving to be national leaders in transportation who provide transportation infrastructure and services for the 21st century that deliver new economic opportunities for all Kentuckians.

Mission

To provide a safe, efficient, environmentally sound and fiscally responsible transportation system that delivers economic opportunity and enhances the quality of life in Kentucky.

Agenda

- **Message**
- Connected Vehicle Data
- Work Zone Safety Applications
- Weekly Work Zone Reports
- Pooled Fund Opportunity

Message

- Connected Vehicle Data is an important source of information for identifying areas of interest
 - Hard Braking is a good surrogate for crashes
 - We can effectively map in real time queue lengths and duration
- Key applications of hard braking
 - Back of Queue
 - Critical areas in a work zone

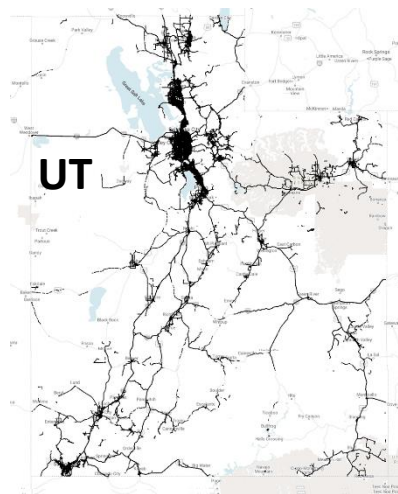

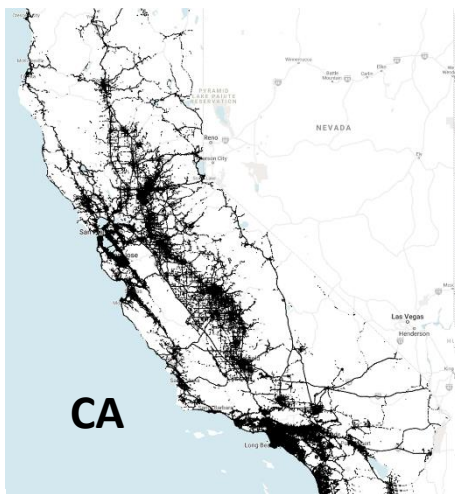

Our vehicles know more about our roads than we do.
Connected vehicle data is particularly important for understanding and managing construction work zone traffic.

Indiana ingests 11 billion connected vehicle records a month (in real time)

One Hour of Connected
Vehicle Data from
Selected States

Connected Vehicle Hard-braking is more scalable and better than looking for skid marks

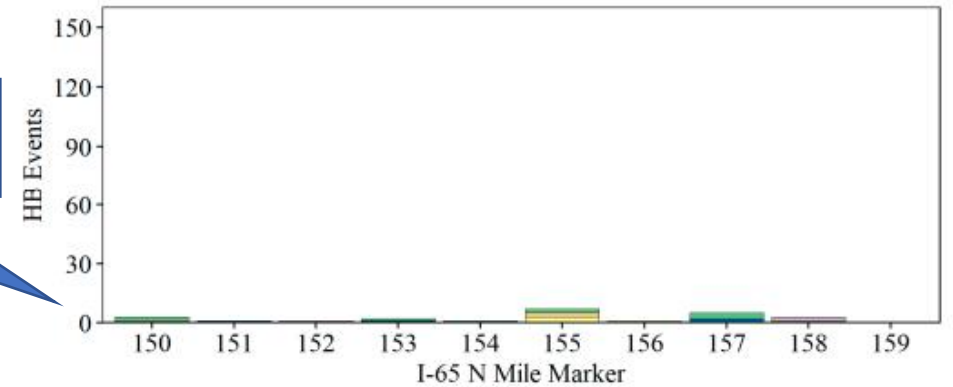

Hard Braking & 10 Mile Work Zone Queue

Hard-braking Events in Region of WZ By Mile Marker

Monday Tuesday Wednesday Thursday Friday Saturday Sunday

Before Lane Shift
(Dec 2020 During Pandemic)

After Lane Shift
(May 2021)

Pooled Fund Study: Work Zone Analytics

Background & Impact

For the past 3 years, Purdue University and the Indiana Department of transportation have been monitoring congestion and hard braking data across all 2600 miles of Indiana Interstates using connected vehicle data. Figure 1 illustrates one such report for I-465 that shows the impact of the 2021 construction activities on congestion.

However, hard braking data has been found to be even more insightful and is a [modern day](#) surrogate for looking for skid marks on the road (Figure 2). For example, if one looks at hard braking connected vehicle data shown in Figure 3, one can see the horizontal line of hard braking at approximately MM 154.4, the same location as the Figure 2 photo that shows the entry into the work zone and the skid marks. Furthermore, one can visualize the impact of a crash that occurred in the work zone at approximately 11:00 a.m., and the subsequent queue that extended approximately 5.5 miles. One can also see numerous hard braking at the back of the queue as free flow traffic approached the queued traffic and suddenly slowed.

Figure 4 provides a crisp example of how these hard braking can be used to identify specific locations along a road that should be looked at further by comparing the before construction (Figure 4a) with the connected vehicle hard braking data during construction (Figure 4b).

Figure 5 and Figure 6 provide similar examples of specific work zone locations highlighted by a change in hard-braking activity which were then mapped using drone imagery to identify contributing factors the cause of the hard-braking.

Research Need

These reports have evolved over the past 3 years in Indiana and there is a need to develop a multi-state consensus on the most effective reports. This will provide a framework to formalize the reporting models, data reduction processes and decision making process so these techniques can be scaled to other states so they can pro-actively identify emerging safety concerns in their work zones, conduct effective after action reviews of past work zones, and ultimately identify best practices for future work zones that minimize congestion, hard braking and ultimately crashes.

Research Tasks

1. Meet with panel members to review work zone analytic reports that can be produced with existing data as well as formulate prioritized list of desirable additions to those reports. Developing a shared vision among multiple states will facilitate scaling this data and stimulate engagement with the connected vehicle data providers. For example, hard braking is useful, but there may be some opportunities to adjust or provide variable hard braking thresholds.
2. Identify commercial probe data sets that are available and procure probe data for each participating state. Data will include passenger car trajectories and passenger car hard braking, and commercial truck trajectories. There are also emerging data sets
 - a. From trucks that provide hard braking and lateral deviation.
 - b. From passenger cars that provide lateral deviation and lane marking quality.
3. Perform penetration analysis of connected vehicle data to understand how it varies by state. There is broad interest in ensuring that the connected vehicle data is representative and has sufficient penetration to provide accurate performance measures.

4. Prepare weekly work zone safety and mobility analytics report for distribution to member states.
5. Prepare weekly work zone change in hard-braking activity report for distribution to member states.
6. Conduct monthly webinars with participating states to review their reports, highlight emerging locations of safety and mobility concerns, and compare and contrast emerging best practices.
7. Convene panel of participating states and key stakeholders to review the multi state deployment of work zone reports and to obtain consensus on recommended data items to collect and the reporting format.
8. Prepare final report that summarizes research and has a recommended implementation plan for states to deploy weekly work zone analytics.

Funding Request

This will vary depending upon what data the state already has access to and what we will have to purchase for the Pooled Fund Study for Work Zone Analytics.

Proposed Start Date

April 1, 2023

Mobility Performance

Why is it important to measure mobility performance in work zones?

- Work zones often require changes to roadway configurations (lane width and lane capacity reductions, diversions).
- These changes impact the mobility performance of the roadways (increased travel time, bottlenecks, queues).
- Agencies design and implement various work zone strategies and technologies to address/mitigate these mobility impacts.
- Identifying, measuring, and quantifying the mobility measures will enable agencies to assess the effectiveness of their work zone management strategies.

Mobility Performance Measurement Examples (slide 1/4)

Mobility Performance Measurement Examples (slide 4/4)

Monthly mobility report example comparing travel speeds in work zones

Source: Ohio Department of Transportation

Mobility Performance Measures

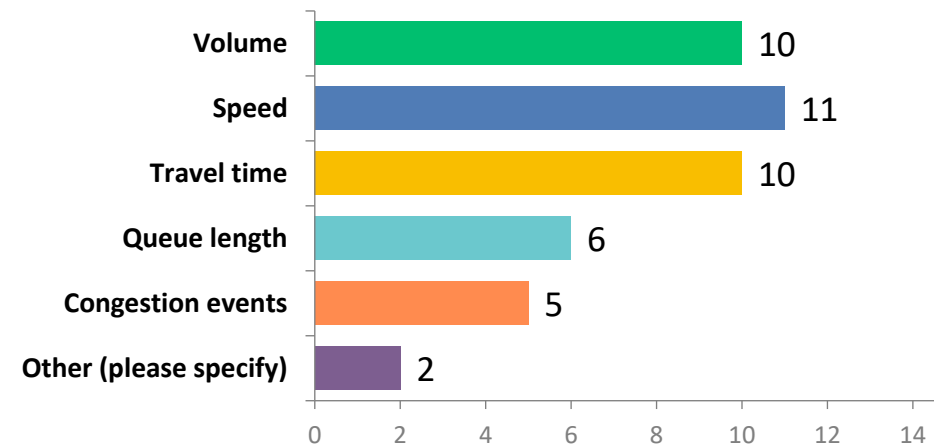

- Conventional Measures—Traditional Data:
 - Total delay
 - Delay per vehicle
 - Number of queuing incidents exceeding the agency's mobility policy
 - Duration of queues
 - Number of traffic congestion events per million work zone vehicle miles traveled
 - Percentage of traffic experiencing work zone congestion or delays
- Measures—Emerging Data:
 - Number of jams; total jam delay (Waze™)
 - Jams during crashes (within crash locations and timeframes); crash-jam-related delay

Survey Responses: Mobility Performance Area (slide 1/2)

Does your work zone policy have a defined mobility measure?

Mobility Data Collected

6 out of 13 respondents mentioned that their agency's work zone policy has a defined mobility measure. States have access to traditional and emerging mobility data, and advanced analytical tools. Filtering mobility data specific to work zones require data integration and processing.

Survey Responses: Mobility Performance Area (slide 2/2)

Do you filter your mobility data to your work zones?

Do you use your mobility data to quantitatively assess your work zones?

7 out of 13 respondents indicated that their agencies filter mobility data specific to work zones. 9 out of 13 respondents indicated that their agencies do not use mobility data to quantitatively assess work zones.

Iowa DOT's Traffic Critical Program

□ Mitigation strategies

- Traffic Incident Management Planning
- Work Day Restrictions (Day of Week / Seasonal)
- Limited Working Hours / Night Work
- Public Information (PI) Plan
- Innovative Contract Provisions (Lane Rental)
- Accelerated Scheduling
- Work Zone Length/Area Restrictions
- Intelligent Work Zones (IWZ)

Fields Devices Used:

- Sensors
- Cameras
- Dynamic Message Signs
- Truck Entering System
- Bluetooth Sensors

Work Zone Performance

IOWA STATE UNIVERSITY
Institute for Transportation

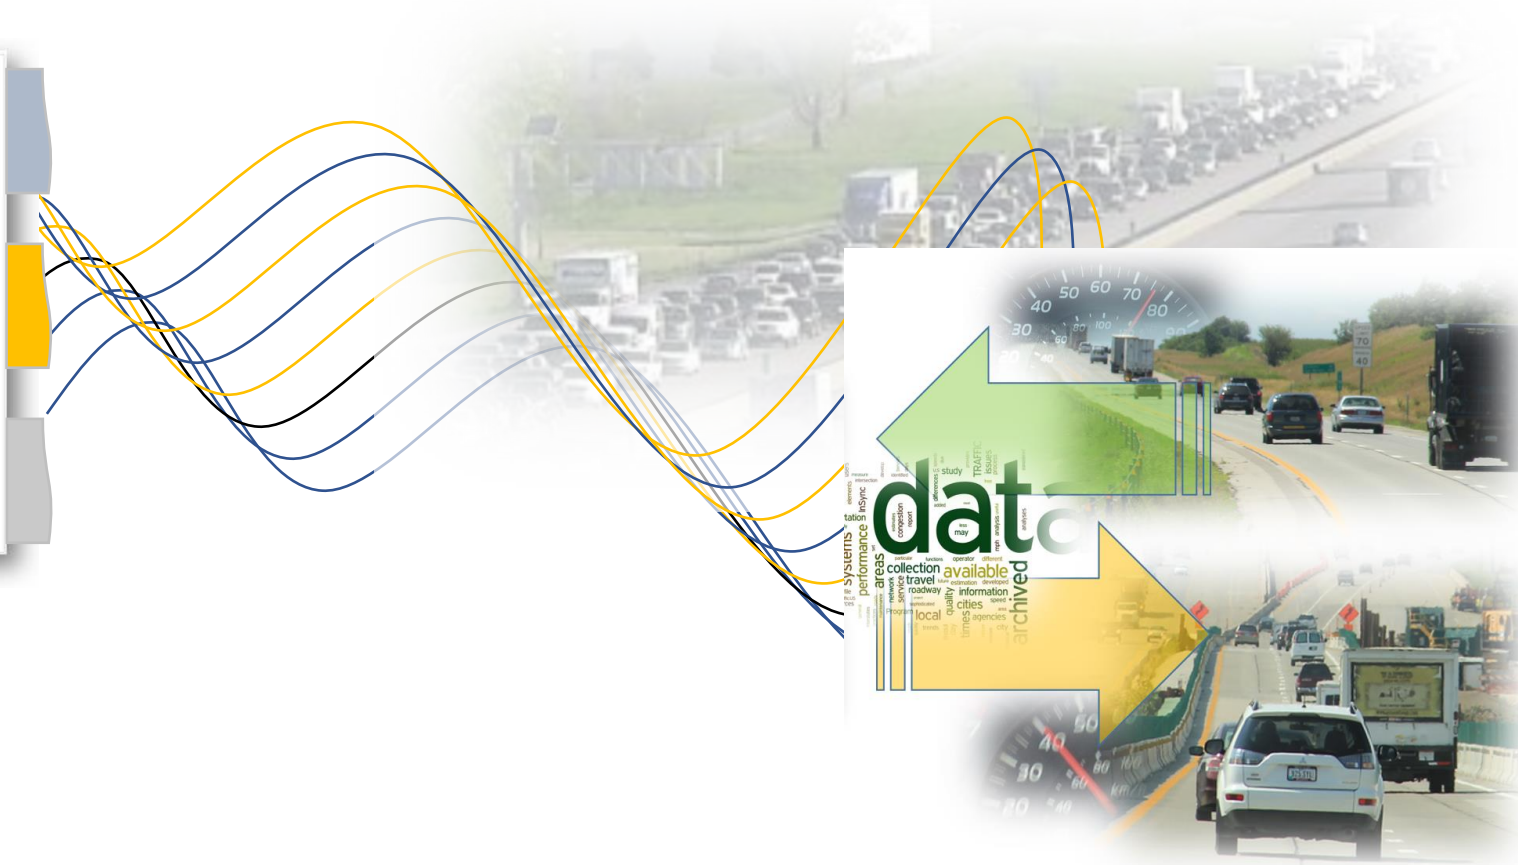

270TH Street

Started Performance Monitoring in 2014

Work Zone Performance

Goal:
**Accessible timely data and
information for critical decisions**

Alerting

TRAFFIC MANAGEMENT CENTER

The wall of monitors displays a comprehensive traffic management interface. It includes:

- Live Camera Feeds:** Multiple screens showing real-time views of highways such as Council Bluffs I-80, Des Moines I-235, Cedar Rapids I-380, and Iowa City I-380/US 218.
- Traffic Flow Data:** Screens showing traffic volume and speed for various segments, such as IA 12, IA 27, and I-35.
- Incident Reports:** Alerts for events like 'LEFT SHOULDER BLOCKED' and 'STALLED VEHICLE'.
- Map Views:** Regional maps showing the location of monitored segments.
- Performance Metrics:** Bar charts and graphs showing system performance and incident response times.

Alerting

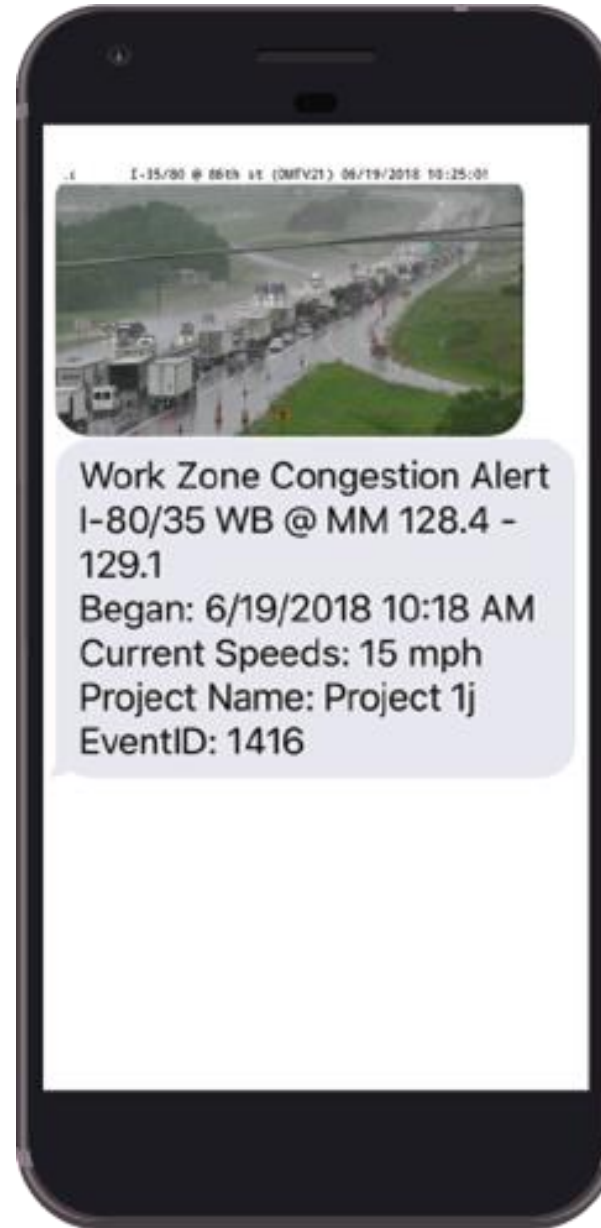

- **Machine Learning Decision Boundaries** to identify slow and stopped conditions
- Alert DOT for significant events and minimize false calls

- Normal
- Slow Traffic Ahead
- Stopped Traffic Ahead

Using RITIS for Work Zone Performance Management and Reporting

Coverage Areas for Today

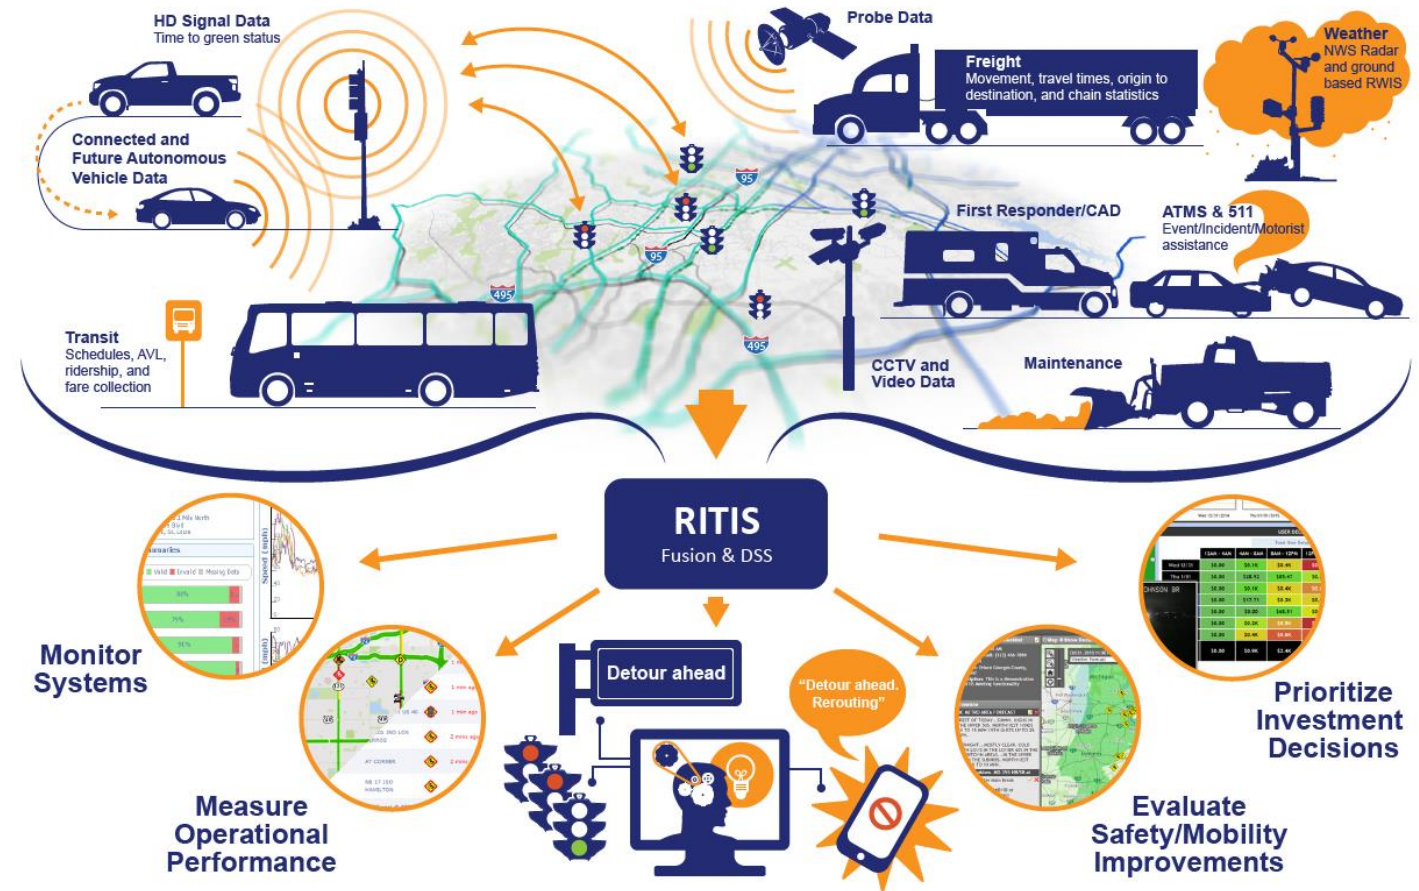

RITIS - the Regional Integrated Transportation Information System - is:

- A big data aggregation and dissemination platform
- Used for situational awareness, data archiving and deep-dive analysis
- Has over 10,000 users in 45 states

A RITIS User Group was formed to:

- > Share best practices
- > Learn about the latest features
- > Suggest improvements

Click [here](#) to get information from past RITIS User Group meetings

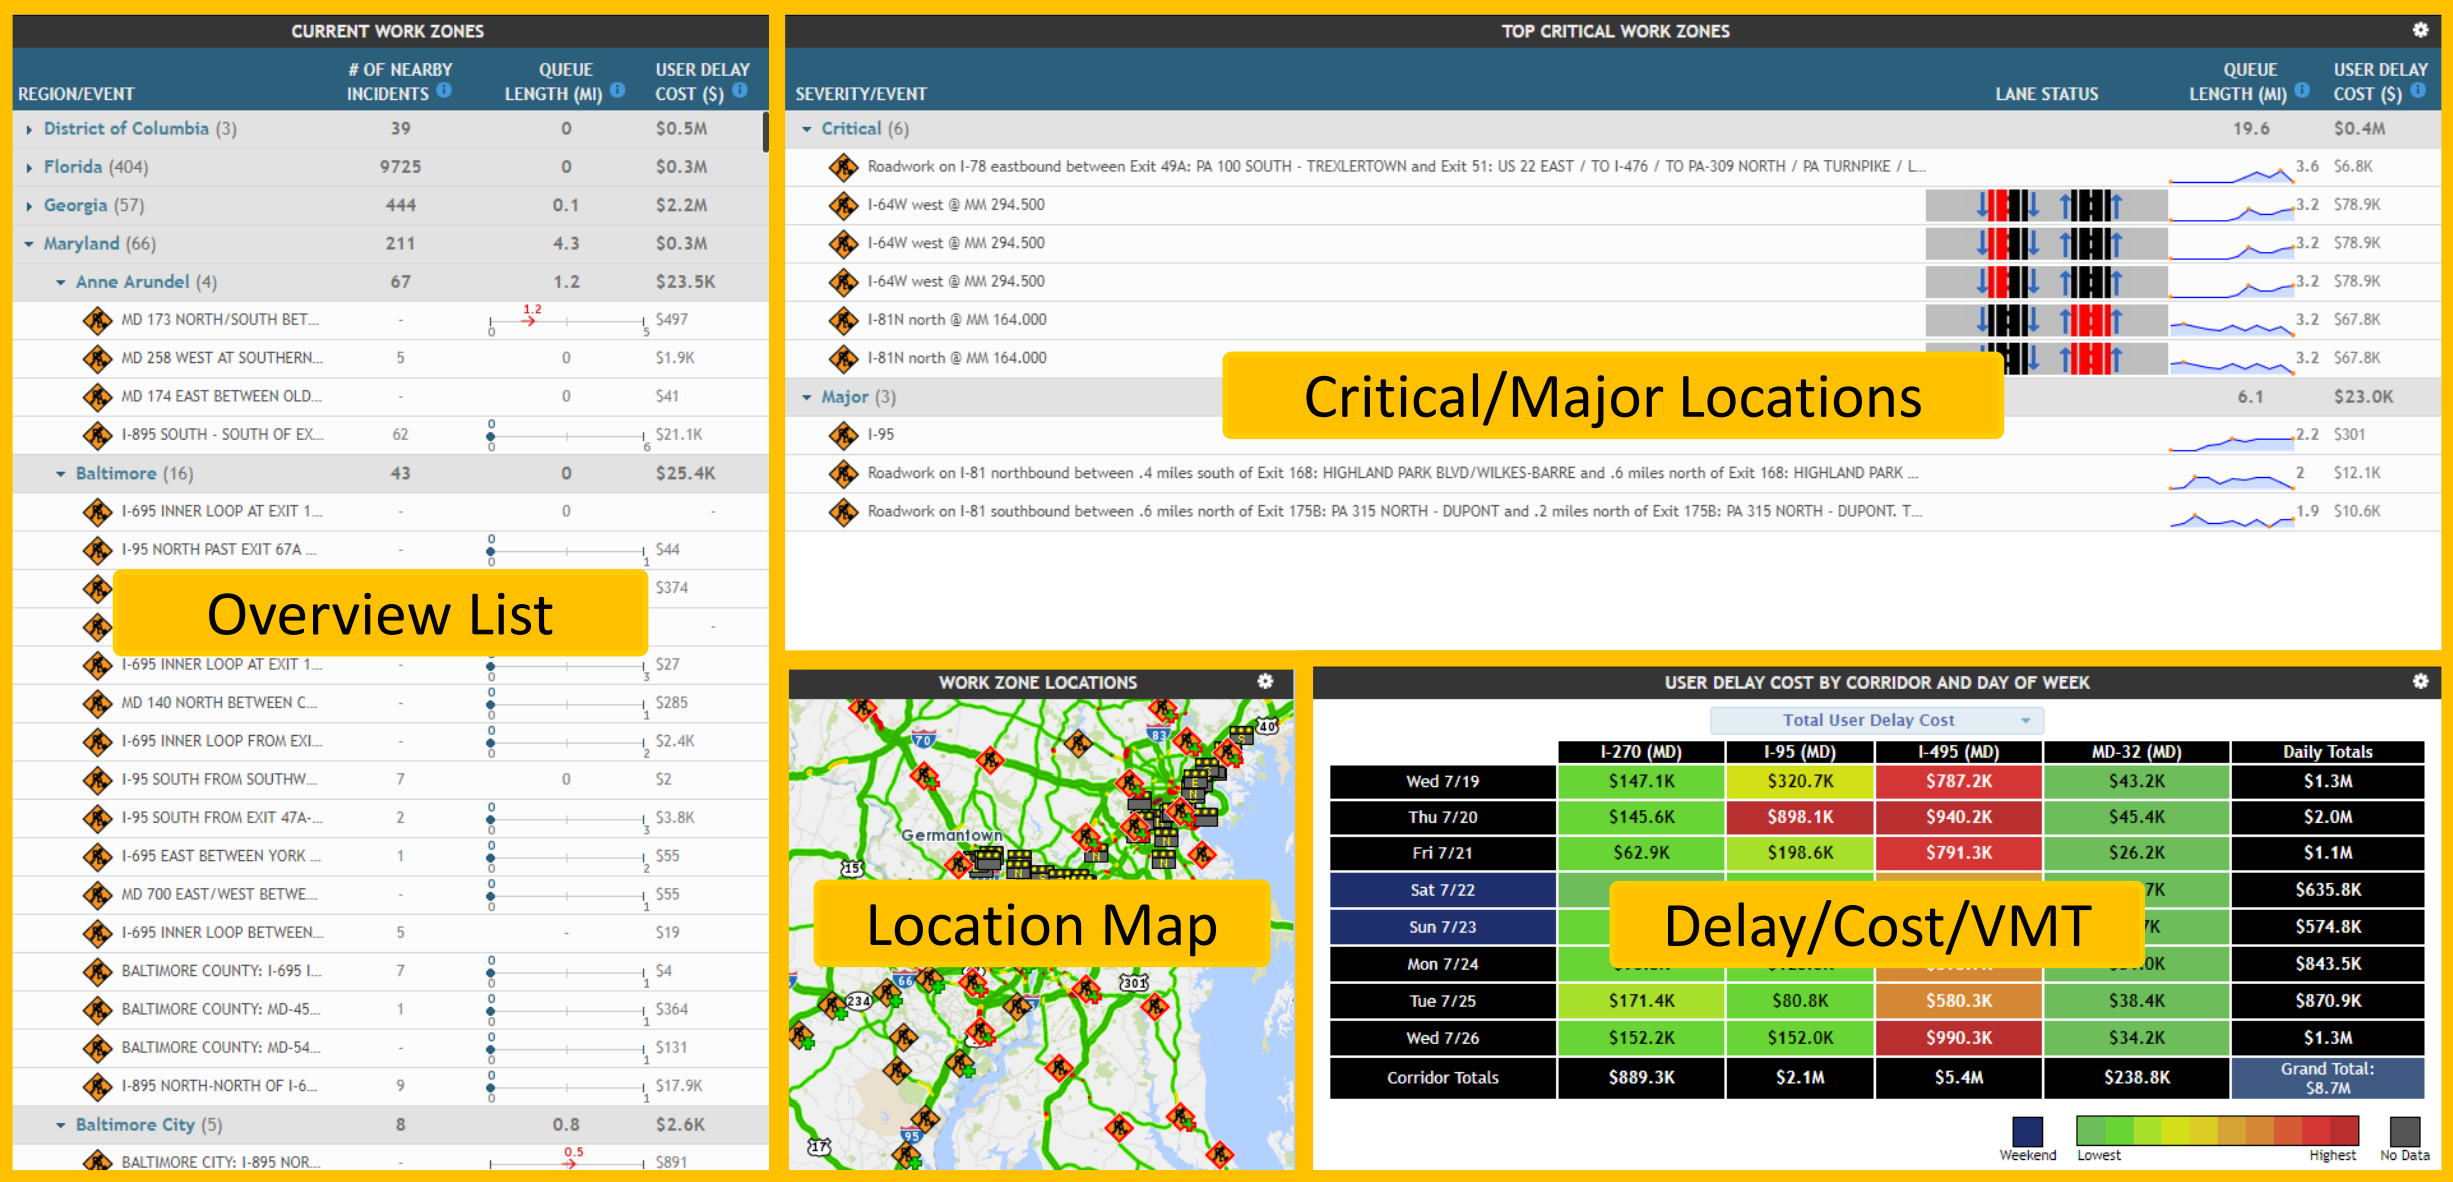

Click [here](#) to learn more about RITIS

What is the Work Zone Performance Monitoring Application?

- › WZPMA is a *real-time* performance monitoring tool for work zones
- › It offers a simple, effective and systematic approach to assessing and managing work zone impacts of roadway projects
- › It uses vehicle probe data and active work zone information

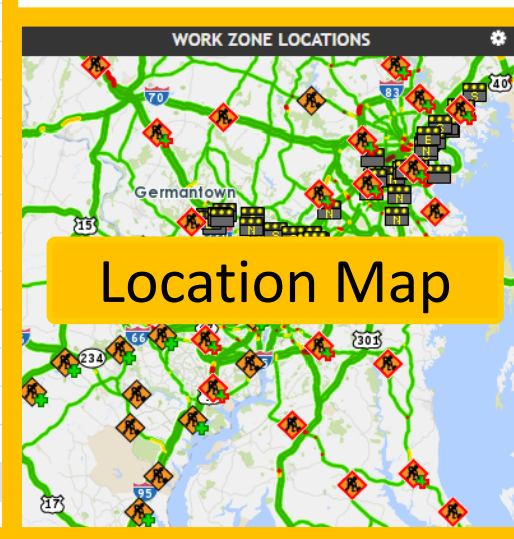

Work Zone Dashboard provides a comprehensive overview of your state's work zones

Work Zone Alerts gives you maximum flexibility in setting up personalized alerts

1. Event conditions

2. Alert notification type

3. Alert timeframe

CREATE AN ALERT FOR THIS WORK ZONE

Fill out each section to set up an alert for this work zone.

1. Alert me if...

- An accident happens near this work zone.
Within mile(s) upstream or mile(s) downstream
- There is a bottleneck that's head or queue includes this work zone.
Keep in mind [the formula for determining bottleneck conditions](#).
- Alert me only when the queue upstream from the work zone exceeds mile(s)
- Speeds in the work zone fall below or exceed a certain range.
 - When speeds fall below mph
 - When speeds rise above mph

Alert me when speed is out of range for longer than minute(s)
Alert me when speed returns within range for longer than minute(s)

2. Alert me by...

- Send me an email
Alert will be sent to your account email: *jallen35@umd.edu*
- Send me a text message
Enter your phone number

3. Alert me when...

Work Zone Performance Reporting

Work Zone Reporting Templates • Automated Work Zone Reporting

RITIS Performance Reporting Templates

The [RITIS Templates](#) page – spearheaded by the RITIS Performance Reporting Working Group – provides a gallery of performance reporting packages for a variety of agency applications.

Each report package contains:

- A base template
- Design resources
- Agency use case examples
- Links to video tutorials of RITIS tools
- Design recommendations
- A step-by-step how-to guide

We're continually updating the gallery with new reporting packages and additional use case layouts.

Templates

This template gallery provides performance reporting examples you can download and use - with output from RITIS tools and your own content - to create professional, easy to understand reports. To get started, click on any of the report icons below to learn more about each type of report, how they were created and access a fully editable PowerPoint™ template file.

[CORRIDOR PERFORMANCE REPORT](#)

Create a report that describes the performance of a corridor over a selected time periods (quarterly, yearly) and compares that performance with previous periods.

[MONTHLY CONGESTION REPORT](#)

Create a monthly report that describes the performance of a roadway over the previous 12 months.

[PROJECT ASSESSMENT REPORT](#)

Create a report that describes the performance of a roadway or corridor before and after an operational or capital improvement project.

[TOP 10 BOTTLENECKS REPORT](#)

Create a report that summarizes the top 10 bottlenecks in your area.

[AFTER ACTION REVIEW](#)

Create an after action review of a major incident.

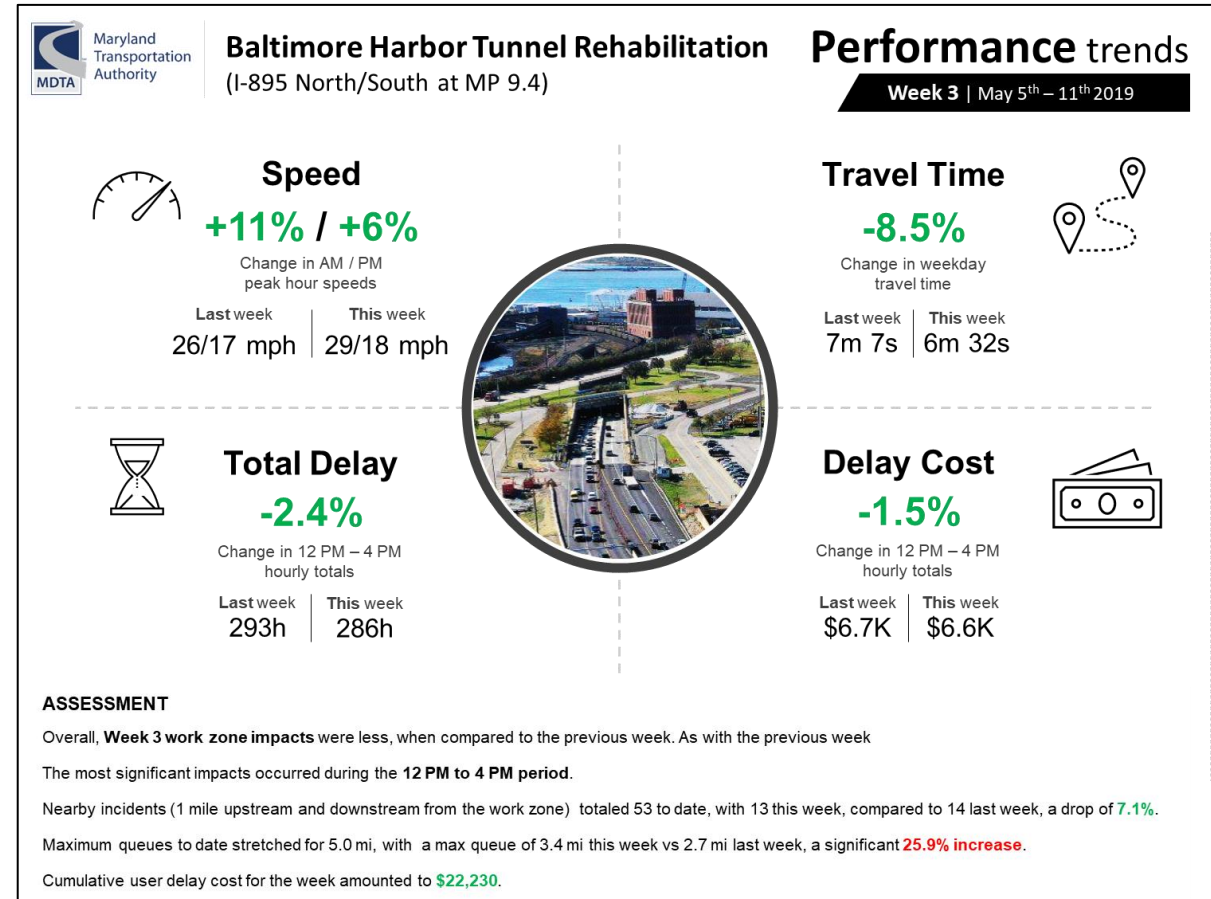

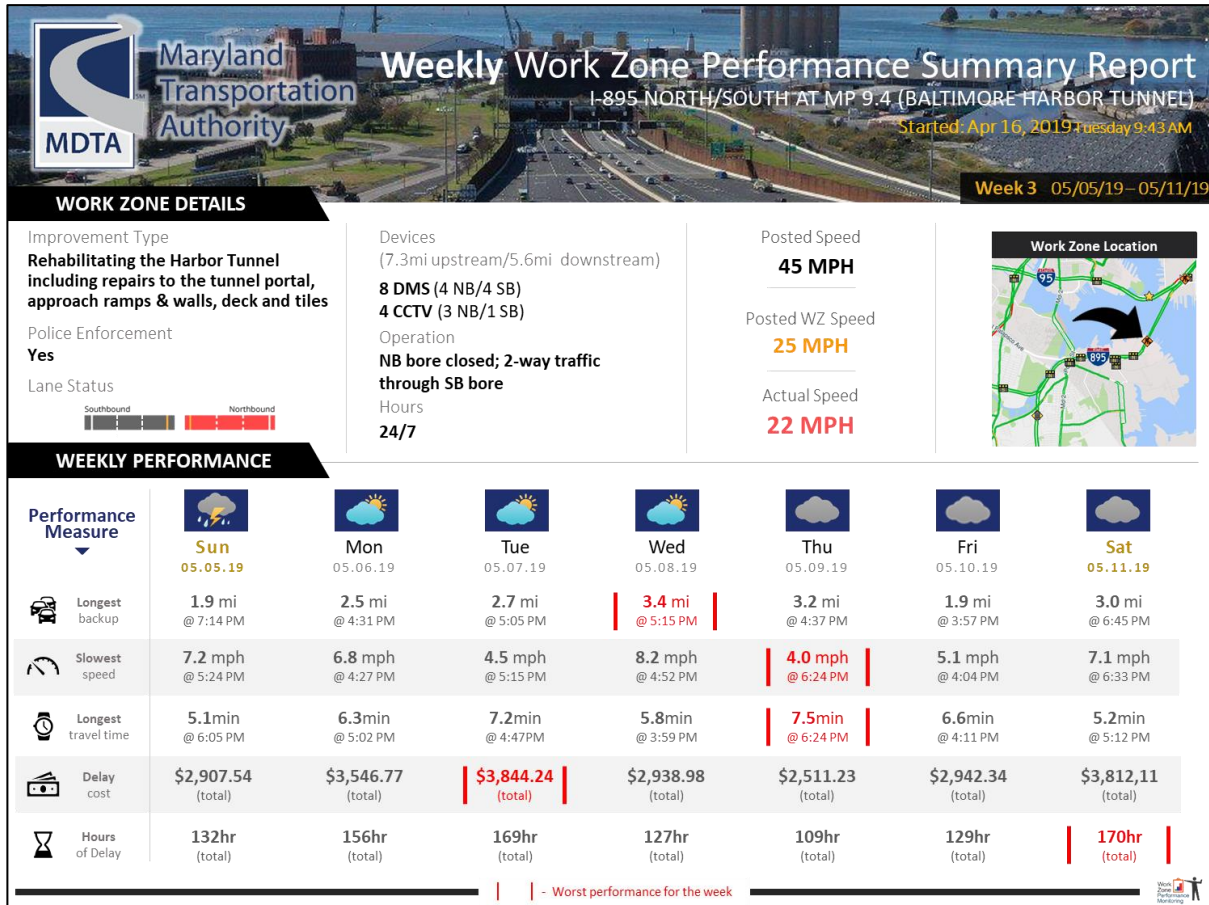

[HOLIDAY TRAVEL FORECAST](#)

Create an infographic that predicts holiday travel conditions based on previous years.

RITIS Work Zone Reporting Templates

The RITIS Performance Reporting Working Group will be developing Work Zone reporting products as our next task

Top 10 RITIS Priorities (from a RITIS User Group survey)

The RITIS Enhancement Working Group – a pooled fund-like group formed to fund RITIS enhancements – sees **Automated Work Zone Reporting** as a highly-desired feature.

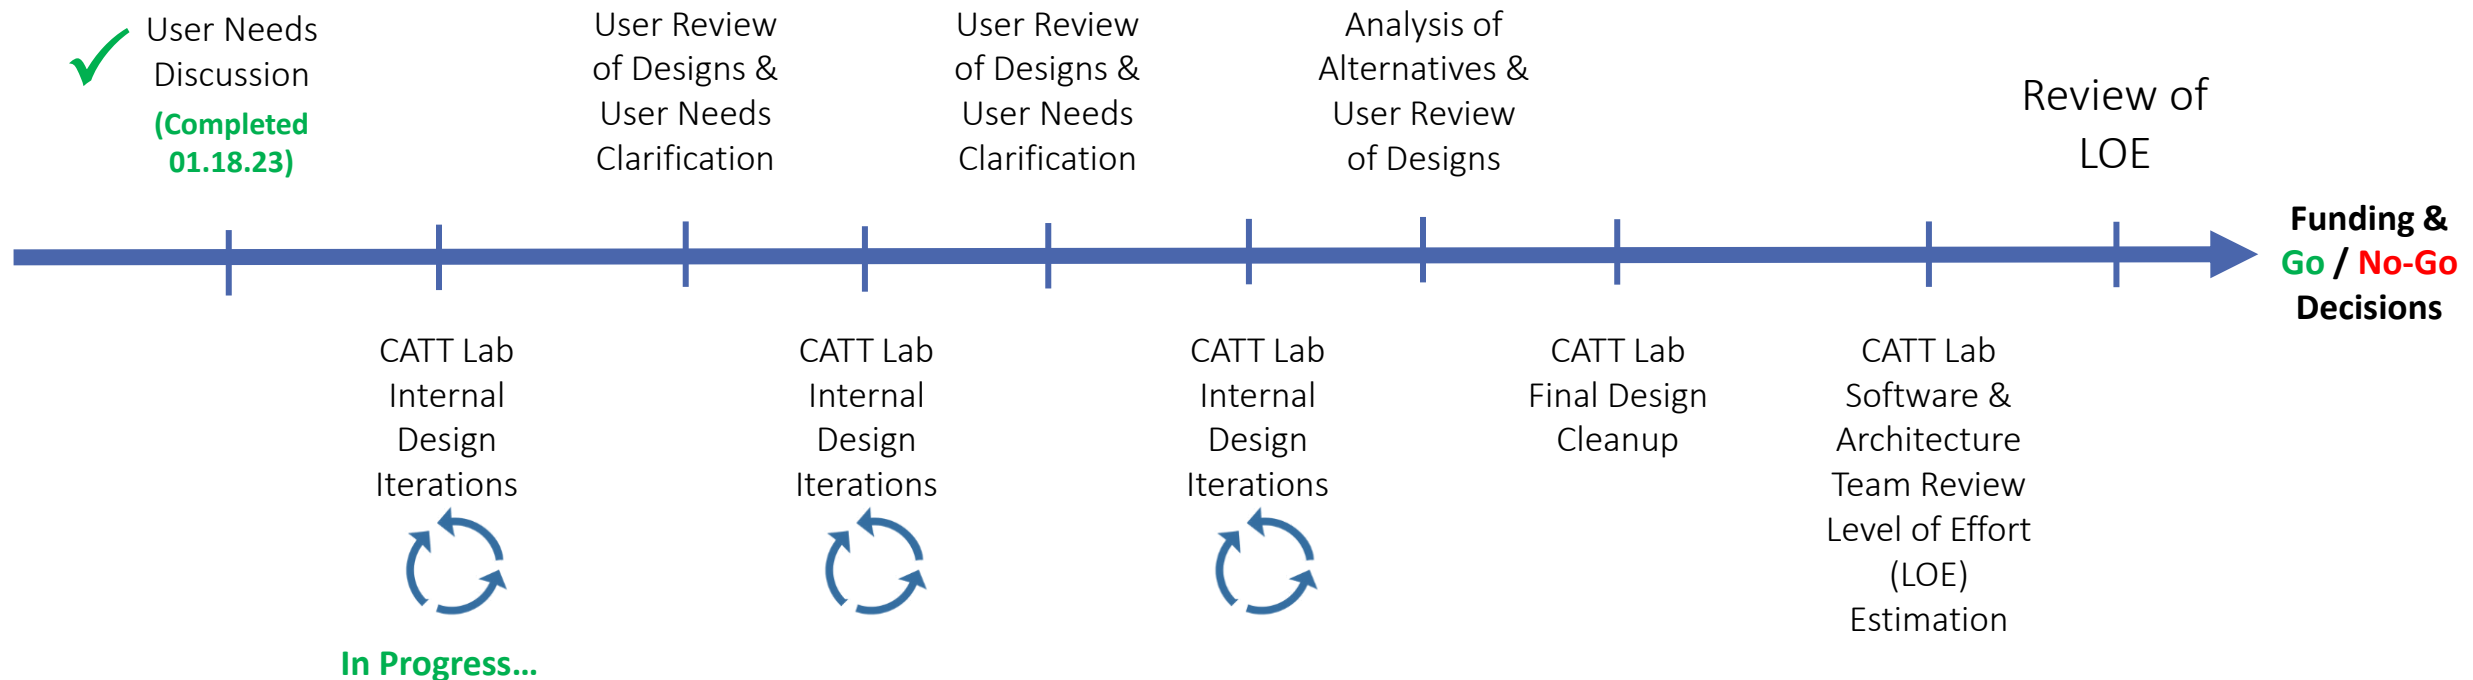

Automated Work Zone Reporting

IN PROGRESS

We've kicked off the scoping study design process w/partners from the **RITIS Enhancement Working Group** to determine the Level of Effort for AWZR:

Scoping Study Design Process

Work Zone Reporting Categories/Elements

Here are some early-on report categories & elements under consideration for both template and auto reporting:

Work Zone Profile

- **Location (Map)** in relation to the city and DMS used to message the work zone + detour routes
- **Spatial length** of the work zone
- **Duration** of the work zone (operating hours)
- **Work type** (repaving, guard rail repair, etc.)
- **Lanes** impacted
- **Types of countermeasures** deployed (barrels, arrow board, police, HAAS, etc.)

Safety

- **Number and type of incidents/fatalities** within work zone
- **Number and type of incidents/fatalities** within queue (may not be possible)

Performance Measures

- **Hourly speeds, delay**
- **Maximum and average queue length; duration**
- **Maximum and average travel time/planning time index** through work zone compared to typical
- **Cost of congestion** compared to typical cost of congestion

Agency-added/Misc.

- **A block for a brief explanation** of key aspects (trends, operation, special event) of the work zone
- **Weather-related** information
- **Crash-related** information
- **Daily, Weekly, Monthly and/or Life of Work Zone** reporting periods

Thank you!

Agency Efficiency

Why is it important to measure agencies' efficiency in implementing work zones?

- Transportation agencies invest considerable resources to design, plan, and implement work zones to improve motorist safety and access on their roadways.
- Evaluating and quantifying the efficiency of the work zone agencies in implementing the work zones in comparison to the agency goals and policies will enable the work zone agencies to gauge and drive investment decisions.

Agency Efficiency Performance Measurement Examples (slide 1/2)

Work Zone Traffic Control Strategy	Category	Interstate		U.S. and Iowa Route		County Road		City Road

Work zone traffic control strategies receiving an exceptional or acceptable rating for more than 75% of reviews

Source: Iowa Department of Transportation

Agency Efficiency Performance Measurement Examples (slide 2/2)

Number of enforcement hours in Illinois work zones

Source: Illinois Department of Transportation

Agency Efficiency

- Measures:
 - Work zone field review ratings (acceptable versus unacceptable)
 - Project completions on schedule
 - Project costs (actual versus planned)
 - Number of enforcement hours per work zone

Survey Responses: Agency Efficiency Performance Area (slide 1/2)

Do you use agency efficiency data to quantitatively assess your work zones?

Agency Efficiency Data Collected

11 out of 13 respondents indicated that their agencies do not use agency efficiency data to quantitatively access work zones.

THANK YOU!
